

Defense of a Master's Thesis

*Managing Off-Grid Power Use for Solar-Fueled Residences with Smart Appliances,
Prices-to-Devices, and IoT*

by
Donnelle January

For the MSCP degree in Computer Engineering

Availability of electricity has significant impact on improving the quality of life. In developing countries, remote villages are often not connected to the utility grid. Solar power can be used for local generation of electricity. In this thesis, the matching of supply and demand of locally generated electricity for a typical residence in a remote village is studied. A new method is developed and evaluated whereby electricity use is managed using local price as a scarcity index communicated using IoT. Electricity consuming devices independently use this price value to determine how much electricity they will consume. A simulation model of a solar-powered residence in Cameroon is used to study the effectiveness of the new method for improving quality of experience for residents. A key measure is the number of blackout (loss of power) incidents. The control methods significantly reduce blackouts enabling critical devices, such as freezers for food and medicine, to operate reliably.

THE PUBLIC IS INVITED

Examining Committee

Ken Christensen, Ph.D., Major Professor

Srinivas Katkoori, Ph.D.

Yao Liu, Ph.D.

Robert Bishop, Ph.D.
Dean, College of Engineering

Dwayne Smith, Ph.D.
Dean, Office of Graduate Studies

*If you require a reasonable accommodation to participate, please contact the
Office of Diversity & Equal Opportunity at 813-974-4373 at least five (5) working days prior to the event.*
